Introduction

BioAustralis is pleased to announce the release of over 60 new microbial metabolites, adding to our extensive catalogue. Most are first-to-market.

Microbial pesticides, products of intense interest for agrochemical research, are a focus of our August 2024 new products offering.

- *Antifungals* – canadensolide, hymeglusin, funiculosin, ilicicolin H, sporminarins A and B, and sordarin;
- *Antiinsectans* - leporin A and haenamindole;
- *Plant growth regulators* - scytalone, neovasinin, cis-ferulic acid and methyl cis-ferulate;
- *Nematicide* - 4-hydroxyscytalone.

Other metabolites of high interest are,

- *Stromemycin*, an inhibitor of metalloproteinase-3, patented for treatment of connective tissue disorders. Lack of availability has hindered full investigation of this interesting metabolite.
- *Sambutoxin*, a platelet aggregation inhibitor with remarkable antiproliferative effects, which inhibits ROS production and induces G2/M arrest and apoptosis by activating the mitochondrial apoptosis pathway.
- *N-Hydroxyapiosporamide*, an antitumor pyridine that directly binds to ROR γ and inhibits its transcriptional activity, blocking signalling transmission in a small cell lung cancer model.

Cephalosporin Metabolite Set

Product Description: Cephalosporin C was first isolated from *Cephalosporium acremonium* in 1953 by Newton and Abraham, Oxford University. The core structure of cephalosporin is a fused β -lactam-dihydrothiazine system. The importance of the cephalosporin family in modern medicine is due to its resistance to β -lactamase and its versatility for producing semi-synthetic derivatives through which the spectrum of action has been extended from broad Gram-positive activity to include some Gram-negative organisms. The Cephalosporin Metabolite Set contains important examples of generations I to IV, as well as the key synthetic intermediate, 7-amino-3-cephem-4-carboxylic acid.

Chlortetracycline Degradation Set

Product Description: Chlortetracycline is the first tetracycline discovered from nature and has been one of the most important antibiotics in human and animal health for over 60 years. Chlortetracycline is a linear tetracycline which can be degraded under various conditions, such as acidity, alkalinity, heat, oxidation, light and temperature. The degradation products are not biologically inert; rather they are oxidative and isomeric analogues with unique physical and chemical properties that are not well characterised. The Chlortetracycline Degradation Set provides the major degradation products described in the literature as a tool for understanding and monitoring the fate of chlortetracycline in biological systems and on storage.

Erythromycin Degradation Set

Product Description: Erythromycin A is a structurally complex macrocyclic lactone which can be degraded by acidity, alkalinity, heat, oxidation, light and temperature. In vivo, erythromycin A may also undergo enzymic conversions via hydrolysis, oxidation, derivatisation and coupling. The degradation products are not biologically inert; rather, they offer new structures with unique physical and chemical properties that are often poorly understood. The Erythromycin Degradation Set provides the major degradation products described in the literature as a tool for understanding the complexity of erythromycin degradation in both in vivo and ex vivo systems.

Erythromycin Metabolite Set

Product Description: Erythromycin A is the major analogue of a complex of closely related analogues produced by *Saccharopolyspora erythraea* to become the first macrocyclic lactone antibiotic. Metabolite complexes are common in microbial fermentations and provide an ecological advantage to the microbe in a hostile and bio-diverse environment via differing physico-chemical properties and spectra of action. The Erythromycin Metabolite Set includes the major co-metabolite analogues of erythromycin described in the literature and provides a tool for understanding the pharmacological potential in nature's design of the erythromycin family.

L-Homoserine Lactone Analogue Set

Product Description: L-Homoserine lactones comprise a family of mediators of cell to cell interactions between bacteria, notably in bacterial biofilms. When secreted by the producing bacteria, homoserine lactones modulate a diverse range of metabolic functions in surrounding species, regulating not only growth and motility but also the production of secondary metabolites such as antibiotics. The most significant variable defining the function of the homoserine lactones is the length of the acyl chain, with shorter chains displaying opposing actions to the longer chains. The L-Homoserine Lactone Analogue Set provides the full set of available homoserine lactones from acetyl (C2) to octadecanoyl (C18).

Quinolone Metabolite Set 1

Code No.: BIA-MS5032

Product Description: The quinolones are a set of broad-spectrum antibiotics with notable activity against Gram-negative bacteria. The class has been researched for over 50 years, with the core structure discovered as an impurity in industrial chloroquine synthesis eventually leading Sterling Drug Company to the first-in-class drug nalidixic acid. Alterations of the functionality about the quinolone core have led to the development of several generations of compounds, with early generations active against Gram-negative bacteria such as *Pseudomonas*, and some Gram-positive bacteria such as *Staphylococcus aureus*.

The Quinolone Metabolite Set 1 contains important examples of first and second generation quinolones, together with nalidixic acid. Ofloxacin and ciprofloxacin are the most widely used members of this generation.

Quinolone Metabolite Set 2

Code No.: BIA-MS5033

Product Description: The quinolones are a set of broad-spectrum antibiotics, with notable activity against Gram-negative bacteria. The class has been researched for over 50 years. Alterations of the functionality about the quinolone core have led to the development of several generations of analogues. Later generations have expanded Gram-positive coverage to include penicillin resistant and sensitive *Streptococcus pneumoniae* as well as atypical pathogens such as *Mycoplasma pneumoniae* and *Chlamydia pneumoniae*, and broad anaerobic coverage.

The Quinolone Metabolite Set 2 contains important examples of third and fourth generation quinolones. Levofloxacin and moxifloxacin are listed as Essential Medicines by the WHO. Levofloxacin, one of the first Gen 3 quinolones, was developed by Daichi Sankyo in the early 1990s and approved by the US FDA in 1996.

Rifamycin Metabolite Set

Code No.: BIA-MS5014

Product Description: The rifamycins are a group of ansamycin antibiotics produced by *Amycolotopsis rifamycinia* active against Gram positive and Gram-negative bacteria. The rifamycin complex (rifamycins A, B, C, D and E) was first isolated by researchers at Dow-Lepetit, Italy, in 1957. Development of the rifamycins continued over the next 10 years, culminating in the introduction of rifampicin (rifampin) in 1968. The rifamycins are potently active against mycobacteria, providing the mainstay of treatment for tuberculosis, leprosy and mycobacterium avium complex infections. The rifamycin analogue set provides a comprehensive selection of the natural product rifamycin B, its derivatives and semi-synthetic analogues, including rifampicin.
